AlcorCut Pro — Installing the watch app

For testing on a Samsung Galaxy Watch 4 or newer (or another Wear OS watch). Keep this sheet handy.

1. On the watch: turn on developer mode

1. Open **Settings** → **About watch** → **Software**.
2. Tap **Software version** 5 times, until it says developer mode is on.
3. Go back to Settings and open **Developer options** (at the bottom).
4. Turn on **ADB debugging**.
5. Turn on **Wireless debugging** (Debug over Wi-Fi).
6. Make sure the watch and the phone are on the **same Wi-Fi**.

2. On the phone: install a sideloading app

1. Open the Play Store and install a free watch installer app, e.g. **Wear Installer 2** or **Bugjaeger**.
2. Open it and follow its steps to connect to the watch over Wi-Fi (it shows the watch's IP address and asks you to allow the connection on the watch — tap **Allow**; on some watches you first pair with a code shown under Wireless debugging).

3. Install AlcorCut Pro on the watch

1. On the phone, open the AlcorCut Pro **Releases page** on GitHub and download **AlcorCutPro-WATCH-<version>.apk** (the phone keeps using AlcorCutPro-ARM-<version>.apk as usual).
2. In the installer app, choose that APK file and tap **Install** — it is copied to the watch and installed.
3. Open **AlcorCut Pro** on the watch, open Capture on the phone, and use the watch as a remote.

Good to know

- The phone and watch apps must be the same version.
- When you're done testing, you can turn ADB and Wireless debugging off again (they use a little battery).
- Later, for customers, the watch app comes through the Play Store automatically — no developer mode needed.
